## BİZLER KİMİZ?

Makine, otomotiv, inşaat, havacılık, savunma vb. sektörlerde ileri teknoloji içeren tezgâhların kullanımı hızla artmaktadır. Kullanılan kesici ve takım tutucularının sayısı da her geçen gün artmaktadır. Bu ihtiyacın karşılanmasıından yola çıkan TAKIMSAŞ, standart ve özel takım üretimine 1987 yılı sonrasında, ülkemizde bir marka olarak başlamıştır.

Ülkemiz sanayisi büyümeyecek gelişmektedir. Tüm sanayici ve çalışanlarımızın katkılarıyla, ülkemiz ihracat ve ekonomik verilerinin son zamanlarda artması, bizlere de bu başarıda onurlu bir geçmişe sahip olmanın mutluluğunu yaşıyor.

Firmamızın, ileri teknoloji içeren tezgâhlar kullanması ve her geçen gün sayılarının artması, kapasitemizi, kalitemizi geliştirirken, topluma olan sosyal sorumluluğumuzu artıran saygının bir göstergesi olarak algılanması, bizlere güç vermektedir.

Rekabette vazgeçilmez unsur kabul edilen HIZ ve KALİTE talaşlı imalat operasyonlarında daha hassas, standartlara uygun, verimli, ekonomik ve daha üretken imalat yapılabilmesi bakımından çok büyük öneme sahiptir. İşleme zamanlarını kısaltan, üretkenliği ve verimliliği artıran özel takımların geliştirilmesinin de hızlı üretim teknolojisinde ayrı bir yeri bulunmaktadır.

Firmamız, gerek müşteri ve bayi bekleyenlerinin gerekse talaşlı imalattaki teknik problemlerin çözümünde büyük öneme sahip olan, standart tutucu ve kesici takımların üretiminin yanında ÖZEL TUTUCU ve TAKİMLARIN da geliştirilmesi, yüksek hız nedeniyle hassaslaştırılması gereğinin, yaşadığı yıllara dayalı tecrübelerle bilincine varmıştır.

Takımsaş, büyük oranda DIN standartlarına uygun olarak hazırlanan takım, tutucu ve kesicilerini üreterek ya da ithal ederek müşterilerinin kullanımına sunmakta, problemlerine çözüm ortağı olmaktadır. Bununla beraber, sektörde liderliğini koruyabilmek için ISO 9001 Kalite Yönetim Sistemi, ISO 14001 Çevre Yönetim Sistemi, TS 18001 İş Sağlığı ve Güvenliği Sistem belgelerini almış ve gerekli olanlarını almak için çalışmalarını sürdürmektedir.

Ülkemiz ekonomisine ve talaşlı üretmeye yıllarca katkıda bulunmanın gönül huzurunu, sevincini ve gururunu sizlerin destekleri sayesinde yaşamaktayız; bunu sizlerle paylaşmaktan da onur duymaktayız.

Bizler kim miyiz? TAKIMSAŞ bayi, müşteri ve çalışanlarıyız...

30 Yılı aşan tecrübe...

## WHO ARE WE?

In the industry of machinery, automotive, construction, aerospace, defense etc., the use of machining mills equipped high tecnology has been increasing exponentially. The quantity of toolholders and cutters used in industry is also increasing more and more. Supplying these needs of the industry has become the elementary concept of Takimsas Kesici Takim Makine Sanayi ve Ticaret A.S. and been established in 1987 to manufacture modern and customized tools as a national brand name in this field of business.

Turkish industry is expanding and growing. By regarding recent increases in exports and economic values of our country, we are experiencing the pleasure and proud of having honorable background in this success with the contributions of all our industrialists and employees.

Related to our manufacturing process with high tech machinery and increasing quantity of our products in the market, our capacity and quality is being upgraded with each passing day. We are being motivated and encouraged with our contribution to several industries with our products.

In the competitive market of machining process, the speed and the quality as the accepted indispensable primary matters have great importance in terms of manufacturing features like being more efficient, productive, economical, accurate and up to standard. Developing special tools which increase efficiency, productivity and decrease operation period has also special contribution in serial manufacture.

We can meet the expectations of our dealers and customers because our company gets great advantage of developing and manufacturing customized (special) holders and tools besides of standard holder an cutting tools. These special tools and holders enable to solve some technical problems in the production line. In addition to our technical abilities, our background and experience of several years bring determining the important concepts in production as accuracy of the products.

Takimsas produces or imports tools, holders, cutters and tips most of which complies with ISO standards and offers them to the service of its customers and becomes solution partner.

In order to maintain its leadership in company activities, we have taken some of the standard certificates such as ISO 9001 Quality Management System, ISO 14001 Environment Management System, OHSAS 18001 Health and Safety System. These certificates will be updated each period and some new certificates will be added.

We feel confedence, happiness and pride of go to the economy of our country and taking place in machining production by virtue of you. The most enjoyable and honorable stage of our business is sharing the results with you.

Who We Are? We are TAKIMSAS employees and customers...

Over than 30 years of experience...

## WER SIND WIR?

In der Branche der Maschinen hat Automobil-, Bau-, Luftfahrt-, Verteidigungs usw., die Verwendung der Bearbeitung Mühlen ausgestattet hohen Technologie exponentiell. Die Menge dieser Werkzeughalter und Fräser in der Industrie verwendet wird, auch immer mehr zu. Versorgung dieser Bedürfnisse der Industrie hat sich die elementare Konzept der Takimsas Kesici Takim Makine Sanayi ve Ticaret AS und im Jahr 1987 eingerichtet worden, um moderne und maßgeschneiderte Werkzeuge als nationale Marke in diesem Geschäftsfeld zu fertigen.

Türkischen Industrie wächst und wächst. Mit Bezug auf den jüngsten Anstieg der Exporte und wirtschaftliche Werte unseres Landes, erleben wir die Freude und stolz darauf, ehrenvolle Hintergrund in diesem Erfolg mit den Beiträgen aller unserer Industriellen und Mitarbeiter.

Bezug zu unseren Herstellungsprozess mit High-Tech Maschinen und zunehmende Menge unserer Produkte auf dem Markt, ist unsere Kapazität und Qualität mit jedem Tag aktualisiert. Wir werden motiviert und ermutigt, unseren Beitrag für verschiedene Branchen mit unseren Produkten.

Im umkämpften Markt der Bearbeitung, der Geschwindigkeit und der Qualität der akzeptierten unverzichtbare primären Dinge haben eine große Bedeutung in Bezug auf die Herstellung von Features wie ist effizienter, produktiver, wirtschaftlicher, genauer und aktueller Standard. Entwicklung spezieller Werkzeuge, die efficiency zu erhöhen, hat die Produktivität und die Abnahme Betriebsdauer auch besonderen Beitrag in Serienfertigung.

Takimsas produziert oder importiert Werkzeuge, Halter, Messer und Tipps von denen die meisten mit ISO-Standards entspricht und bietet sie in den Dienst seiner Kunden und wird Lösungspartner.

Um seine führende Position im Unternehmen Tätigkeiten erhalten, haben wir einige der Standart-Zertifikate wie ISO 9001 Qualitätsmanagement, ISO 14001 Umwelt-Management-System, OHSAS 18001 Arbeitsgesundheit und Sicherheitsmanagement übernommen. Diese Zertifikate werden in jeder Periode aktualisiert und einige neue certificates hinzugefügt werden.

Wir fühlen uns Vertrauen, Freude und Stolz, einen Beitrag für die Wirtschaft unseres Landes und findet in der spanenden Fertigung durch Sie. Die schönste und ehrenhafte Teil unseres Geschäfts ist, die Ergebnisse mit Ihnen.

Wer wir sind? Wir sind TAKIMSAS Mitarbeiter und Kunden...

Mehr als 30 Jahre Erfahrung...

## TORNALAMA / TURNING / DREHEN

### DIŞ TORMA KATERLERİ / TURNING - TOOLHOLDER , EXTERNAL

DREHEN - WERKZEUGHALTER, AUßERE : 11 - 53

### DELİK KATERLERİ / TURNING - TOOLHOLDER , INTERNAL

DREHEN - WERKZEUGHALTER, INNERE : 60 - 81

### KESME VE KANAL KATERLERİ / TURNING - GROOVING and PART-OFF TOOLS

KLEMMHALTER, ABSTECHEN UND EINSTECHEN : 94 - 107

## DIŞ AÇMA KATERLERİ / TOOLHOLDER for THREADING

KLEMMHALTER, GEWINDEDREHEN : 108 - 109

### DELİK BARALARI / BORING BARS / BOHRSTANGEN

KARTUŞLAR / CARTRIDGES / KURZKLEMMHALTER : 114 - 115

KARTUŞLAR / CARTRIDGES / KURZKLEMMHALTER : 116 - 120

## FREZELEME / MILLING / FRÄSEN

### KENAR ve YÜZEY FREZELEME / MILLING - SIDE and FACE MILLS

SCHEIBEN UND PLANFRÄSER : 125 - 133

### KANAL FREZELER / MILLING - DISC MILLS / SCHEIBENFRÄSER

PARMAK FREZELER / MILLING - END MILLS / SCHAFTFRÄSER : 134 - 140

PARMAK FREZELER / MILLING - END MILLS / SCHAFTFRÄSER : 144 - 159

## MATKAPLAR / DRILLS / BOHREN

### MATKAPLAR / DRILLS / BOHREN

: 164 - 165

### KLAVUZ MATKAPLI DELME BAŞLIĞI / DRILL HEAD WITH PILOT DRILL

: 167

### AYARLI DELİK İŞLEME KAFASI / ADJUSTABLE ROUGH BORING HEADS

: 178 - 179

### AYARLI DELİK İŞLEME KAFASI TUTUCULARI / ADJUSTABLE TOOLHOLDER

: 180 - 181

FOR BORING BARS / KLEMMHALTER FÜR AUSDREHKÖPFE, EINSTELLBAR

## TAKIM TUTUCULAR / TOOLHOLDERS / WERKZEUGHALTER

### KILAVUZ ÇEKME TUTUCULARI / TAPPING CHUCK HOLDERS /

: 187

### GEWINDESCHNEIDHALTER

: 188 - 192

### PENS TUTUCULAR / COLLET CHUCK HOLDERS / SPANNZANGHALTER

: 194 - 200

### FREZE MALAFALARI / SHELL MILL HOLDERS / AUFSTECKFRÄSENHALTER

: 201 - 206

### WELDON TUTUCULAR / TYPE WELDON HOLDERS / KLEMMHALTER TYPE WELDON

: 207 - 211

### MORS KONİK TUTUCULAR / MORSE TAPER HOLDERS / MORSEKEGELHALTER

: 212 - 214

### KANAL FREZE TUTUCULARI / DISC MILL HOLDERS / SCHEIBENFRÄSERHALTER

: 215 - 218

### ISITMALI TUTUCULAR / SHIRINK CHUCK HOLDERS / SCHRUMPFFUTTER - HALTER

: 220 - 221

### ÇEKİRME VİDASI / PULL STUD / ANZUGBOLZEN

: 223 - 228

### VDI TAKIM TUTUCULAR / VDI HOLDERS / VDI - HALTER

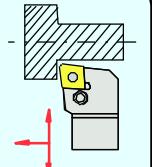

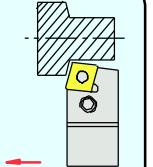

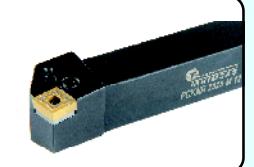

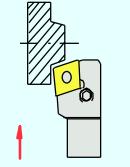

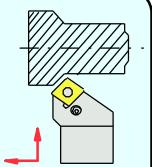

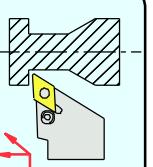

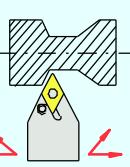

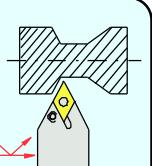

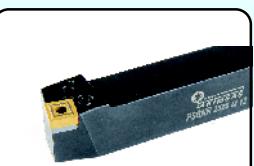

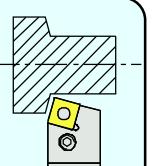

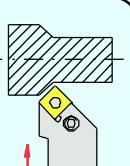

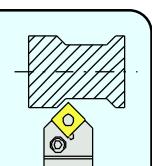

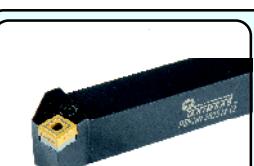

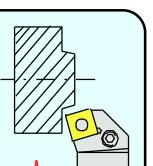

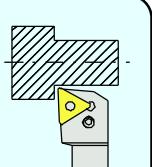

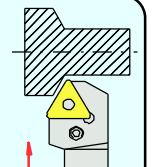

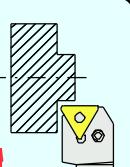

: 229

### ADAPTÖR / ADAPTOR / ADAPTERAUFNAHME

*																																																					
*) Sinterlenmiş alaşımalar , vibrasyon giderilmesinde yükseltici etki yaparlar, Örneğin : wolfram - bakır gibi.																																																					
*) Sintered alloys with increased damping effect , e.g. tungsten copper.																																																					
*) Sinterlegierungen mit erhöhter Dämpfung, z.B. Wolfram - Kupfer.

## Birimler

Gösterim	Tanımlama	Birim
$D_m$	İşleme Çapı	mm
$V_c$	Kesme hızı	m / dak
$n$	Devir Sayısı	dev / dak
$T_c$	İşleme zamanı	dak
$Q$	Kaldırılan talaşın hacmi	cm <sup>3</sup> / dak
$I_m$	İşleme uzunluğu	mm
$P_c$	Net güç gereksinimi	kW
$k_c$	Özgül kesme kuvveti	N / mm <sup>2</sup>
$f_n$	İlerleme miktarı	mm / dev
$\alpha$	Yanaşma ( giriş ) açısı	Derece
$R_a$	Yüzey pürüzlülüğü	μm
$R_e$	Köşe radyüsü	mm
$a_p$	Kesme derinliği	mm

## Formüller

Kesme hızı ( mm / dak )	$V_c = \frac{D_m \cdot \pi \cdot n}{1000}$
Devir sayısı ( dev / dak )	$n = \frac{V_c \cdot 1000}{D_m \cdot \pi}$
Talaş hacmi ( cm <sup>3</sup> / dak )	$Q = V_c \cdot a_p \cdot f_n$
Güç gereksinimi ( kW )	$P_c = \frac{Q \cdot k_c}{D_m \cdot \pi} \left[ \frac{0,4}{f_n \sin \alpha} \right]^{0,29}$
İşleme zamanı ( dak )	$T_c = \frac{I_m}{f_n \cdot n}$
Profil derinliği ( μm )	$R_{max} = \frac{f_n^2}{r_e} \cdot 125$

Problem	Serbest yüzey aşınması	Krater aşınması	Talaş birikmesi	Kesme kenarında talaş birikmesi	Kesme kenarında çentikleme	Sert metal uç kırılması	Termal çatıklar	Plastik deformasyon	Darbeli işlem	İş parçası yüzey hassisiliyetinin bozulması	Uzun ve dolanan talaş (başlangıçta değil)	Çok dar talaş oluşumu

## Units / Berechnungseinheiten

Code / Kurzbezeichnung	Description / Bezeichnung	Unit / Einheiten
D <sub>m</sub>	Machining Diameter / Bearbeitungsdurchmesser	mm
V <sub>c</sub>	Cutting speed / Schnittgeschwindigkeit	m / min
n	Revolution per minute (RPM) / Anzahl Spindelumdrehungen	Rev / min
T <sub>c</sub>	Cutting time / Eingriffszeit	min
Q	Metal removal volumes / Zerspanungsvolumen	cm <sup>3</sup> / min
I <sub>m</sub>	Working Length / Bearbeitungslänge	mm
p <sub>c</sub>	Net power consumption / Netto - Antriebsleistung	kW
k <sub>c</sub>	Specific cutting force / Spezifische Schnittkraft	N / mm <sup>2</sup>
f <sub>n</sub>	Feed per revolution / Vorschub pro Umdrehung	mm / rev
κ <sub>r</sub>	Approach angle / Anstellwinkel	Degrees
R <sub>max.</sub>	Profile depth / Profiltiefe	μm
r <sub>e</sub>	Tip radius / Schneidplattenradius	mm
a <sub>p</sub>	Cutting depth / Schnitttiefe	mm

## Formulas

Cutting speed ( mm / min ) Schnittgeschwindigkeit (m / min)	$V_c = \frac{D_m \cdot \pi \cdot n}{1000}$
Revolution per minute (Rev / min) Anzahl Spindelumdrehungen	$n = \frac{V_c \cdot 1000}{D_m \cdot \pi}$
Metal removal volumes ( cm <sup>3</sup> / min ) Zerspanungsvolumen (cm <sup>3</sup> / min)	$Q = V_c \cdot a_p \cdot f_n$
Power consumption ( kW ) Antriebleistung ( kW )	$P_c = \frac{Q \cdot k_c}{D_m \cdot \pi} \left[ \frac{0,4}{f_n \sin \kappa_r} \right]^{0,29}$
Cutting time ( min ) Eingriffszeit ( min )	$T_c = \frac{l_m}{f_n \cdot n}$
Profile depth ( μm ) Profiltiefe ( μm )	$R_a = \frac{f_n^2}{r_e} \cdot 125$

**İç tornalama işlemlerinde takım seçerken aşağıdaki noktalara dikkat edilmelidir.**

*The below points should be taken account while choosing tools for internal turning.*

Beachten Sie unterstehende Punkte während der Wahl von Klemmhalter für Innenbearbeitung

**Genel tavsiyeler / General Recommendations / Allgemeine Empfehlungen**

- Mümkin olan en büyük şaft çapı seçilmelidir.

*Use largest possible shank diameter.*

Den größtmöglichen Überhang Wählen

- Takım mümkün olan en kısa şekilde bağlanmalıdır.

*Apply the shortest possible overhang.*

Kleinstmöglichen Überhang wählen

- Doğru ve kuvvetli bağlama sistemi kullanılmalıdır.

*Use the correct and stable clamping system.*

Korrekte und stabile Einspannung für die

Bohrstange wählen

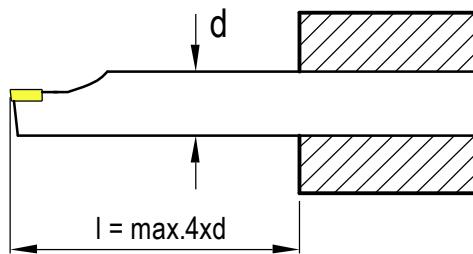

- Kesme sıvısı veya basınçlı hava kullanılması; özellikle derin delik ve kör deliklerin tornalanmasında talaşın dışarıya atılması ve yüzey kalitesinde olumlu etkiler sağlar.

*Use of coolant/lubricant or compressed air can improve chips removal and surface quality particularly in deep-hole boring and blind hole boring.*

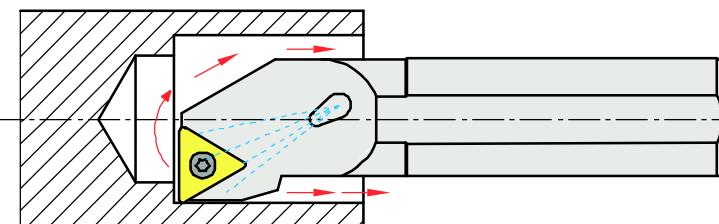

Verwendung von Kühlmittel / Schmiermittel oder Druckluft

Chips verbessern Entfernung und Oberflächengüte insbesondere im Tieflochbohren und Sackloch langweilig.

**Uç kaynatılmış iç tornalama takımı / Solid boring bars / Solide Bohrstangen**

**Mükemmel olan en kısa takım çıkışlığı / Smallest possible overhang / Kleinstmöglichster Auskragung**

**Vibrasyon oluşabilecek işler için, takımların seçiminde göz önünde bulundurulması gereken faktörler.**

*Factors to be considered when selecting the tools for workpiece subjects to vibration :*

Die zu berücksichtigenden Faktoren bei der Auswahl der Werkzeuge für sein Werkstück Themen zu Vibrationen :

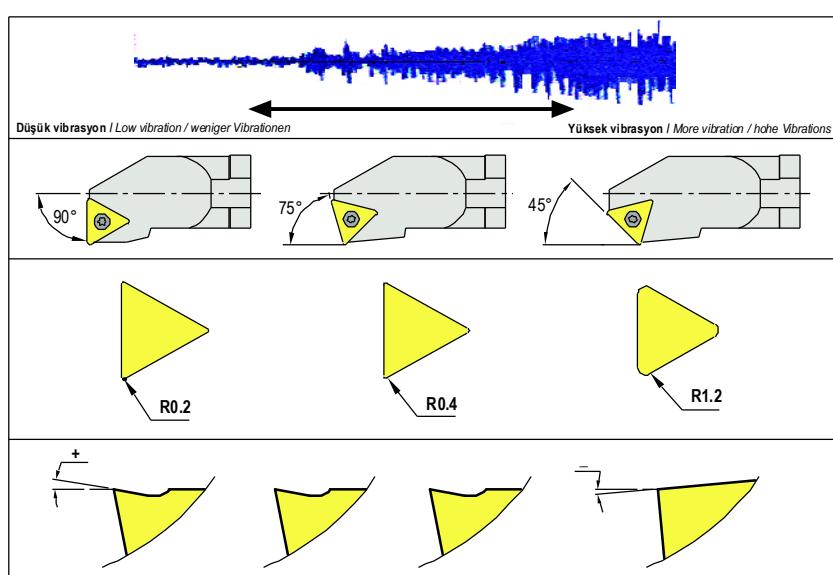

- Yanaşma açısı mümkün olduğunda 90 dereceye yakın olmalı ve 75 dereceden az olmamalıdır.

*The setting angle should be as close as possible to 90 degrees and not less than 75 degrees.*

Der Einstellwinkel sollte so nahe wie möglich an 90° nicht unter 75° liegen

- Küçük köşe radyüsü seçilmelidir.  
*Select smaller insert-tip radius.*  
 Kleinen Eckenradius wählen.

- Pozitif takım ve uçlar kullanılmalıdır.  
*Use positive holders and inserts.*  
 Positive Halter und Wendeschneidplatten wählen.

#### Mekanik Sıkmalı Uç Şekli / Indexable Insert Shape / Wendeschneidplatte Form

- Yandaki şemada yuvarlak şekilden, 35 derece uç açılışlara kadar kullanımı en yaygın olan uçlar gösterilmiştir.

*The figure at the right shows the most common insert shapes from round tips to 35° degrees.*

Die Abbildung zeigt die gebräuchlichsten ISO-Plattenformen von der runden bis hin zur 35° Wendeschneidplatte.

- Şemada okun gösterdiği gibi kesici kenar dayanımı ( S ), geniş açılı uçlara doğru artar; bununla beraber zor ve dar noktalara ulaşılabilirlik ( Z ), dar açılı uçlara doğru artar.

*As it's seen on the figure, the stability of cutting edge (s) increases toward the wide angle tips, although the accession to the hard and narrow points gets difficult toward acute angle tips.*

Die Pfeilskala zeigt, dass die Schneidkantenstabilität (S) mit größer werdendem Eckenwinkel zunimmt. Je kleiner der Eckenwinkel, umso beser ist die Zuganglichkeit. (Z)

- Vibrasyon eğilimi ( V ) uç açısı büyükçe artmaktadır. Uç açısı küçüldükçe güç ( P ) gereksinimi azalmaktadır.

*The tendency to vibration ( V ) increases as the tip angle increases whereas the power required ( P ) decreases as the tip angle decreases.*

Die Pfeilskala zeigt, dass die Vibrationsneigung (V) links ansteigt, während Leistungsbedarf (P) rech niedriger ist.

#### Köşe Radyüsü ve İlerleme / Tip Radius and Feed / Eckenradius und Vorschub

Mekanik sıkmalı ucta köşe radyüsü, işleme esnasında önemli bir faktördür. Örneğin :

*The tip radius of an insert is a key factor that results in :*

Der Eckenradius der Wendeschneidplatte ist ein Schlüsselfaktor in Bezug auf.

- Kaba tornalama sırasında dayanım, Stability during rough turning, Stabilität beim Schruppen.

- Fınış operasyonlarında yüzey kalitesi, Surface quality during finish turning, Oberflächengüte beim Schlichten

#### Kaba Tornalama / Rough Turning / Schruppdrehen

- Kesme kenarı dayanımı yüksek olmalıdır. Bu yüzden mümkün olan en büyük uç radyüsü seçilmelidir.

Use the largest possible tip radius to ensure the greatest degree of stability for the cutting edge.

Größtmöglichen Eckenradius wählen, um eine möglichst stabile Schneidkante zu gewährleisten.

- Uç radyüsünün büyük seçilmesi, daha yüksek ilerleme değerlerine olanak tanır.

*Larger tip radius ensures greater feed rate.*

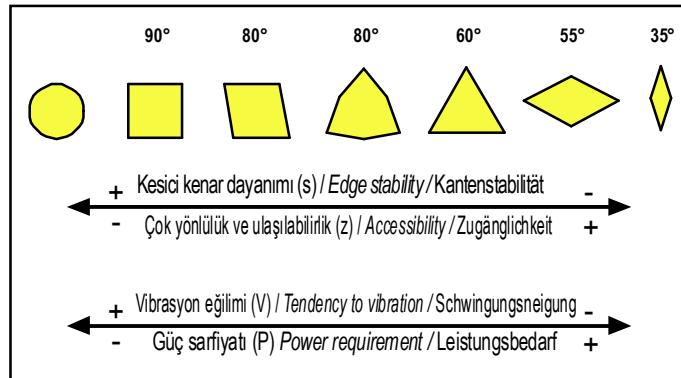

Ein großer Eckenradius erlaubt größere Vorschübe.

- Eğer vibrasyon riski varsa uç radyüsü küçük alınmalıdır.

*Prefer smaller tip radius if there is risk of vibration.*

Bei Vibrationsgefahr kleineren Eckenradius wählen.

- Kaba tornalama kullanılan uç radyüsleri genellikle 1,2 ve 1,6 mm'dir. The tip radius frequently used for rough turning are 1,2 and 1,6 mm. Die bei der Schrubbearbeitung am häufigsten verwendeten Radien betragen 1,2-1,6 mm.

#### Uç radyüsüne göre max. ilerleme değerleri

Maximum feed rate for some tip radius

Maximaler Vorschub für einige Spitzenradius

Köşe radyüsü ( r ) mm Corner Radius ( r ) mm	0.4	0.8	1.2	1.6	2.4
Tavsiye edilen max. ilerleme değeri ( $f_n$ ) mm / dev. Recommended max. feed rate ( $f_n$ ) mm / dev. Empfohlene max. füttern Rate ( $f_n$ ) mm / dev.	0.25-0.35	0.4-0.7	0.5-1.0	0.7-1.3	1.0-1.8

Bu tabloda tavsiye edilen max. ilerleme değerleri, uç radyüsünün  $2/3$  ' üne göre hazırlanmıştır.

*The maximum feeding rates recommended reflect two thirds (2/3) of the tip radius.*

Die maximalen Preise Fütterung empfohlen spiegeln zwei Drittel (2/3) spitzenradius.

#### Aşağıdaki durumlarda daha yüksek ilerleme değerleri uygulanabilir.

Greater feed rates are possible in following cases.

Höhere Vorschübe sind in folgenden Fällen möglich.

-En az 60 derece uç açısına ve iyi bir kesme dayanımına sahip uçların kullanılması halinde,

*When the insert having 60 degrees of tip angle and stable cutting edge is used,*

Wendeschneidplatten mit stabiler Schneidkante und Spitzwinkel von min. 60°

-Tek taraflı talaş kırıcı uçların kullanılması durumunda,

*When the insert having single side chip breaker is used,*

Wenn der Einsatz mit einseitig Spanbrecher verwendet wird,

-90 dereceden daha küçük yanaşma açısının kullanıldığı durumlarda,

*When the insert having setting angle less than 90 degrees is used,*

Wenn der Einsatz mit Anstellwinkel kleiner als 90 Grad verwendet wird,

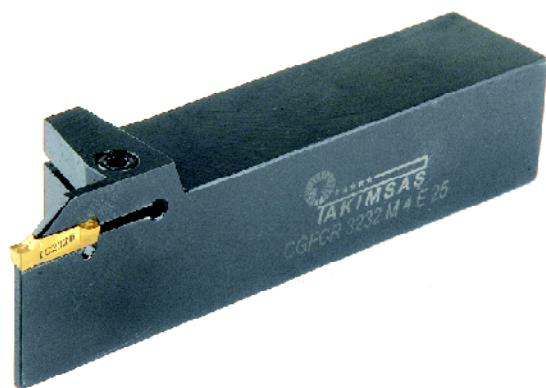

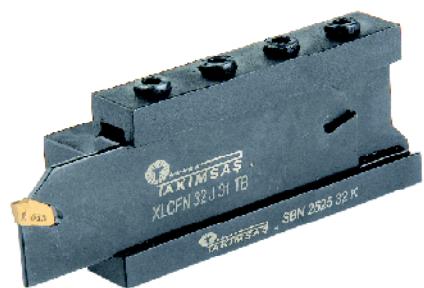

-Normal kesme hızlarında rahat talaş kaldırılabilen malzemelerin işlenmesinde,

*Working with the materials that can be machined easily at normal cutting speeds,*

Die Arbeit mit den Materialien, die leicht an bearbeitet werden kann normalen Schnittgeschwindigkeiten,

Threading methods / Gewindedrehen Methoden

### Üretim Metodunun Seçilmesi

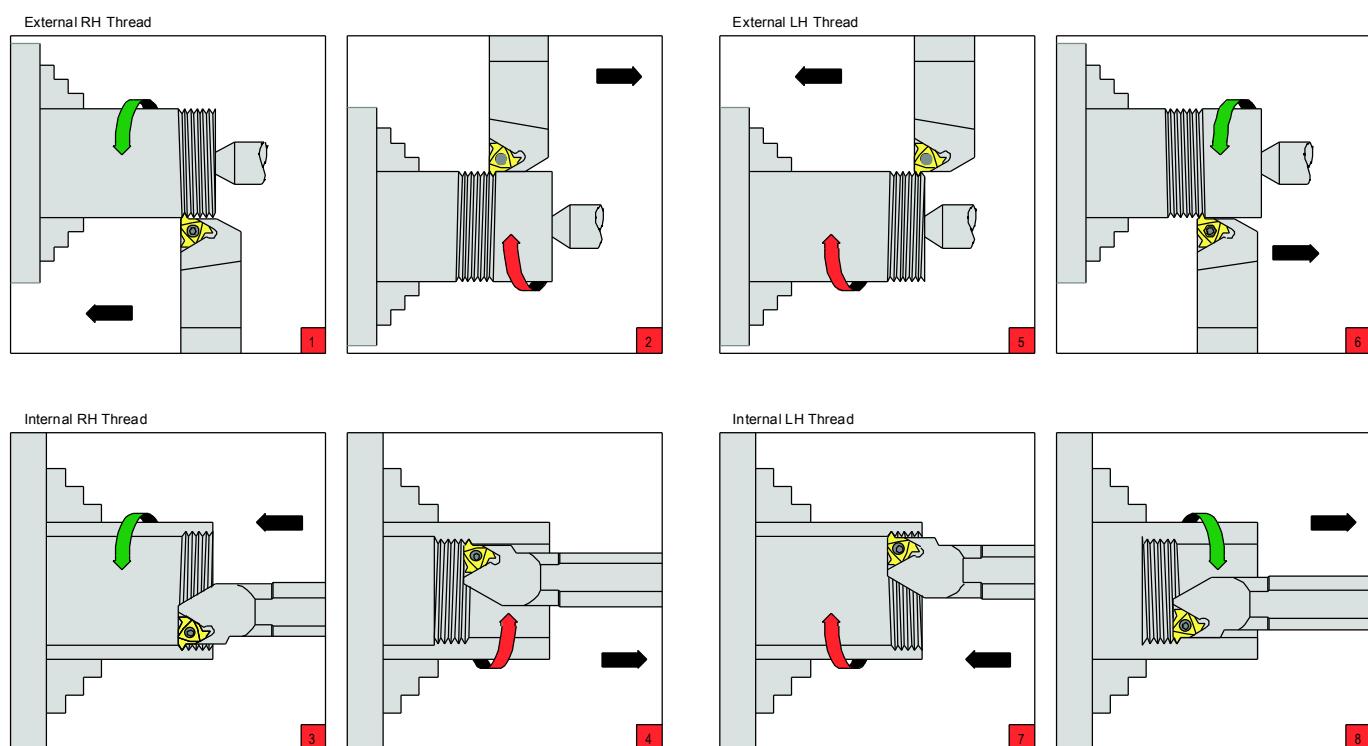

İş parçasının şecline ve takıma uygun olarak, diş açmak için hangi metodun daha uygun olduğunu karar verilir. Genellikle işleme yönü olarak ayna yönüne doğru diş çekme uygulanır. Ayna yönüne ters diş çekmek de mümkün olmakla beraber, ayna yönüne doğru diş çekmek tercih edilir. Kesici takım, çekilecek olan dişin dönüş yönüne göre sağ ve sol olarak seçilmeli ve kullanılmalıdır. Bu durumda sağ diş için sol takım ve sol diş için ise sağ takım kullanılır. Böylece kesici uç ve takım maksimum desteği sağlar. Normal kesme şartlarının yanında tersi de uygulanabilir. Tüm bunlarla birlikte, kater ve kesici uç birbirile uyumlu seçilmelidir.

### Choosing Threading method

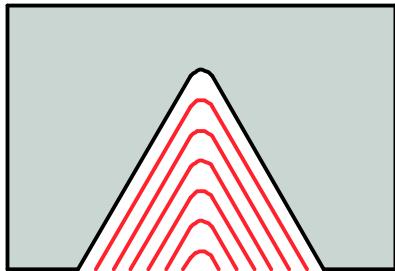

For the threading operation well adapted to process material's form and tool, the most appropriate method is decided. Mostly the selected for threading direction is toward the turning chuck, that is applied. Although threading is possible by diverging from the chuck, threading toward the chuck is preferred. Threading direction is chosen depending on the screwing direction. In this occasion, left tool is used for right screw and right tool is used for left screw. As a result, insert and tool provides maximum support. Besides, for normal cutting conditions, the reverse can be valid too. For all, the

### Die Wahl Gewindedrehen Methode

Für das gewindedrehen - Betrieb gut geeignet, um Material der Form und Werkzeugverarbeiten, wird die am besten geeignete Methode entschieden. Meistens sind die zum Einfädeln Richtung ausgewählt ist in Richtung der Dreh-Futter, das angewendet wird. Alhthough Gewindedrehen ist durch divergierende aus dem Futter possible, Einfädeln auf das Futter preffered. Gewindedrehen direcktion gewählt wird in Abhängigkeit von der Einschraubrichtung. Bei dieser Gelegenheit wird links ttol für rechte Schraube eingesetztund richtige Werkzeug ist für normalen Schneidencontitions, der umgekehrte gültigen too. For alles sein, muss der Halter und der Einsatzentsprechend ausgewählt werden.

## Vida açma operasyonlarında radyal (dik) paso verme çeşitleri

Vida açma operasyonlarında dört farklı radyal paso verme yöntemi vardır:

Dış çapta merkeze doğru doğrusal ilerlemeli,

Radyal paso verme işlemine, dış çapta merkeze doğru düzenli artarak, takıma, iş parçasına ve dış adımla bağlı olarak karar verilir. Konvansiyonel tezgahlarda en çok uygulanan dış açma şeklidir. Talaş formu yumuşaktır ve aynı zamanda kesici uçta aşınma meydana gelir. Normal vida açmak için tercih edilir. Büyük hatveli dislerde talaş kontrolü kötüdür ve yüzeye vibrasyon olur. Sert malzemeler için uygundur, örneğin austenitik paslanmaz çelik gibi. Radyal paso verme işleminde, dış profiliin her iki yanına da aynı anda yük geldiği için, ucun profili oluşturduğu kısımda, aşırı zorlanma ve aşınma meydana gelir. Aynı zamanda, çıkan talaşın atılması da kolay olmaz ve bu durum kesici ucun kendisine de zarar verir.

### The variations of radial pass in threading

There are three kinds of radial pass in threading:

Radial pass towards the center with regular feed

Radial pass from external diameter to the center by regular feed is chosen depending upon the tool, process and pitch.

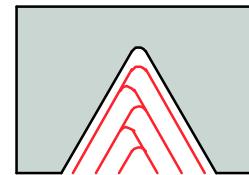

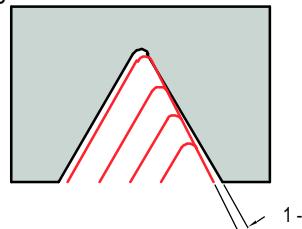

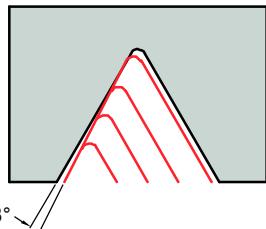

It is the most applied threading method in conventional machines being controlled mechanically. Soft chips form and excess wear on the insert tip are observed together. It is preferred in standard threading methods. Threadings having bigger pitch result in troubles in chip control and vibration occurs, but may practical for hard materials such as austenitic stainless steel. While threading with this method, because of that the both sides of tooth profile loaded at the same time, on the tip section of the insert forming profile, the probability of extra wear and compulsion occurs. Throwing away the chips while threading is not easy and it causes insert being damaged by itself.

### Die Schwankungen der Radial-Pass in Gewindedrehen

Es gibt drei Arten von Radial-Pass in Gewindedrehen

Radial-Pass zur Mitte hin mit regelmäßigen Feed

Radial Pass von Außendurchmesser zur Mitte durch regelmäßiges Feedback wird abhängig von der Werkzeug-, Prozess- und Pitch. Es ist die am meisten angewendete Verfahren Gewinde in herkömmlichen Maschinenmechanisch gesteuert. Soft-Chips Form und übermäßigen Verschleiß an dem EinsatzSpitze zusammen beobachtet. Es wird in standart Threading Methoden bevorzugt. Gewinde mit größerer Steigung result in Schwierigkeiten im Chip-Steuerung undVibrationen auftreten, sondern kann praktisch für harte Materialien wie austenitischer Edelstahl. Während treten bei diesem Verfahren, da der, dass die beiden Seiten desZahnprofils gleichzeitig geladen werden, auf dem Spitzenabschnitt des Einsatzes bildetProfil, tritt die Wahrscheinlichkeit der zusätzliche Verschleiß und Zwang. Wegwerfen des Chips während Einfädeln ist nicht einfach und es verursacht durch Einsatz selbst beschädigt.

Dış çapta merkeze doğru sağa veya sola ilerlemeli,

Dış açma operasyonlarında, dışın profiliin kenarından merkeze doğru ilerlerken, sağa ve sola hareketle çalışma mükemmel talaş kontrolü sağlar. Büyük hatveli dislerde, delik içine dış açma işleminde talaşın dışarıya daha kolay çıkışmasına ve vibrasyondan dolayı yüzey bozulmalarına neden olmaması açısından uygun bir dış açma metodudur. Bu yöntemde, yüzey problemlerine dikkat edilmelidir. Giriş açısı 3° - 5° arasında olmalıdır. Bu methodun ancak CNC kontrollü tezgahlarda uygulanabilme imkanı vardır.

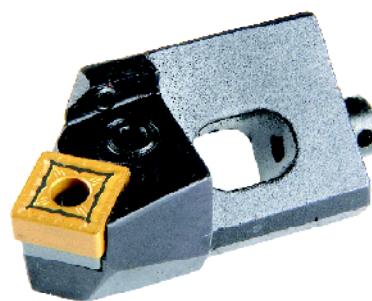

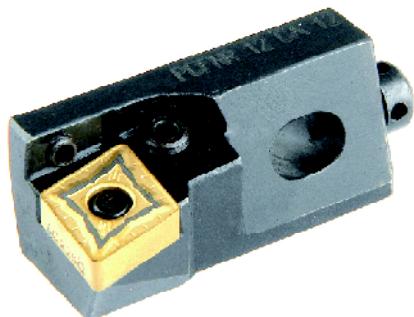

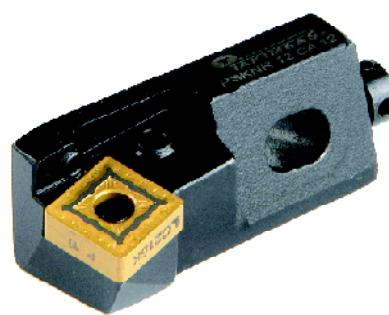

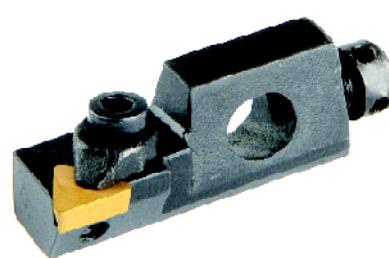

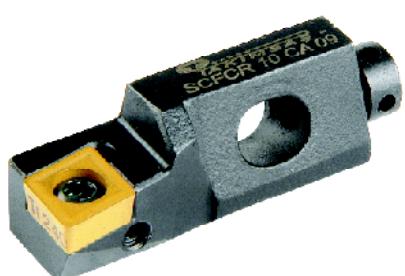

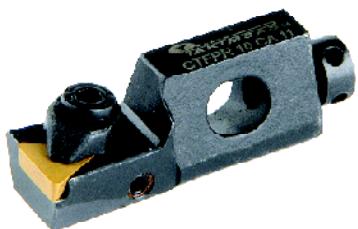

### Radial pass towards the center with irregular feed

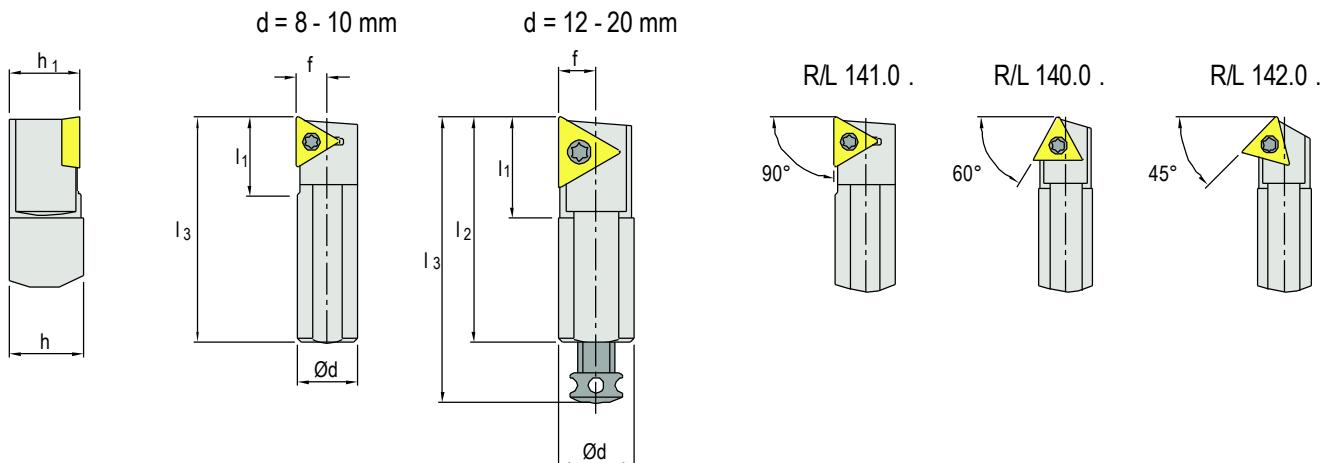

During threading, feeding towards the center provides perfect chip control by right and left stroke. It is convenient for threading having bigger pitch, because it doesn't cause any surface corruption as a result of vibration and it provides perfect chips removal especially for internal threading. Troubles on the surface quality should be avoided. Setting angle must be between 3° and 5°. However this method can be used only in the machines having CNC control.

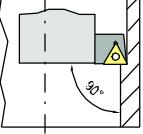

### Radial-Pass zur Mitte hin mit unregelmäßigen feed

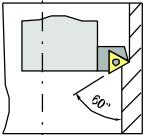

Beim Gewindedrehen, Fütterung zur Mitte hin sorgt für perfekte Spankontrolle durch rechte und linke Schlaganfall. Es ist bequem für das Einfädeln mit größeren Abstand, weil sie nichtdazu führen, jede Oberfläche Korruption als Folge der Vibrationen und bietet perfekteEntfernung Chips speziell für Innengewinde. Troubles auf die Oberflächengqualität sollte vermieden werden. Einstellen muss zwischen 3° und 5° liegen. Allerdings kann diese Methode nur in den Maschinen mit CNC-Steuerung verwendet werden.

#### UYGULAMA TAVSİYELERİ

93 SCN DISC MILL Tipinde dar kanal frezeler, özel kartuş konstrüksiyonları ile 4 mm'ye kadar ayar imkanına olanak sağlar.

1- Standart formunda, montajlı kartuşlar ve ara parçalar ile birlikte kanal genişliği (b) 14 mm'dir.

2- Eğer bir taraftaki kartuşun altındaki ayar parçası kaldırılırsa genişlik (b) 16 mm'ye artırılır.

3- Maksimum kanal genişliğini elde etmek için freze, ayar ara parçaları olmadan monte edilmelidir. Bu konumda kanal genişliği (b) 18 mm'dir.

#### APPLICATION

Disc mill type 93 SCN, provides the possibility of adjusting up to 4 mm by special cartridge.

1- In standard form, cartridge and fastening parts provides width of (b) 14 mm.

2- If the adjustment of cartridge in one side are cancelled, width is enlarged to (b) 16 mm.

3- Maximum width can be achieved without adjustment parts. In that way the width becomes (b) 18 mm.

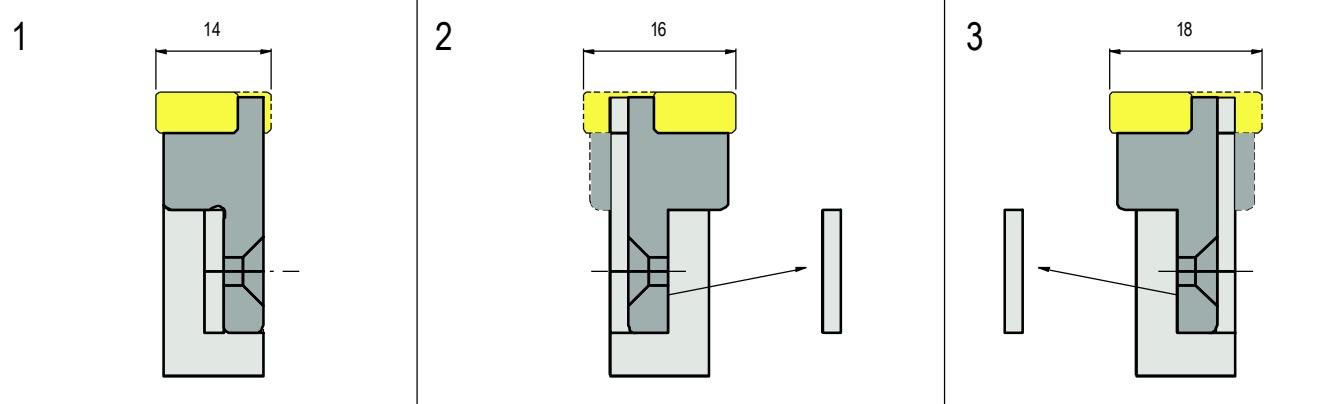

#### ANWENDUNGSEMPFEHLUNGEN

Disc-Mühle Typ 93 SCN, bietet die Möglichkeit der Anpassung bis zu 4 mm durch spezielle Patrone.

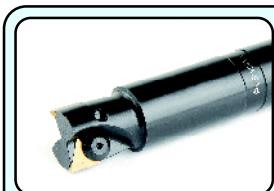

1- In der Standardausführung bietet der Breite der Kurzklemmhalten und Befestigungstechnik (b) 147 mm.

2- Wenn die Einstellung der Kurzklemmhalten in einer Seite abgebrochen werden, wird die Breite (b) 16 mm vergrößert.

3- Maximale Breite Einstellung ohne Teile erreicht werden kann. Auf diese Weise wird die Breite (b) 18 mm.

## Emniyet Bilgileri

- Kesici takımın sabit tutulup işleme parçasının döndürüldüğü hallerde kesim sonunda keskin ve ince bir disk oluşabilecektir. Bir koruyucu MUHAFAZA tavsiye edilir.
- Eğer matkap dönüyor ve soğutma RİNGİ kullanılıyorsa soğutma RİNGİ'nin dönmesi önemlidir.
- Saçılan talaşlardan korunmak için koruyucu MUHAFAZA kullanılması önerilir.

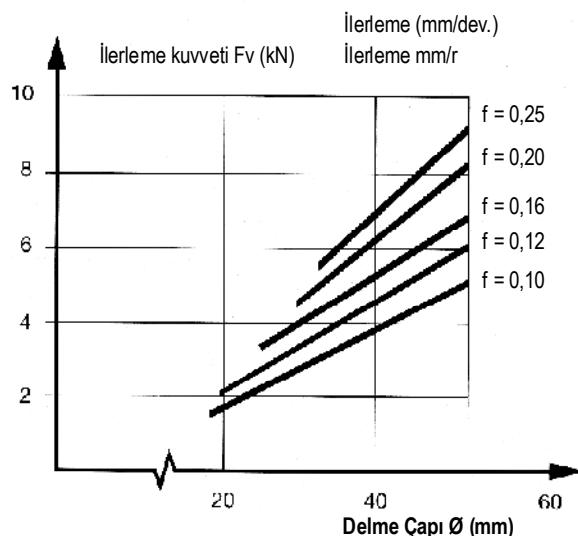

## İlerleme Kuvveti

İlerleme kuvvetleri kesme hızları için belirlenmiştir.

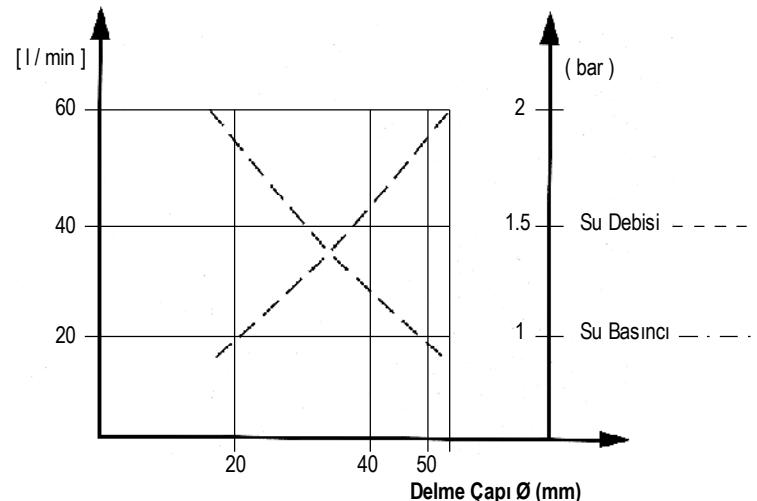

$$v_c = 120 \text{ m/dak.}$$

Malzeme 900 N/mm<sup>2</sup>

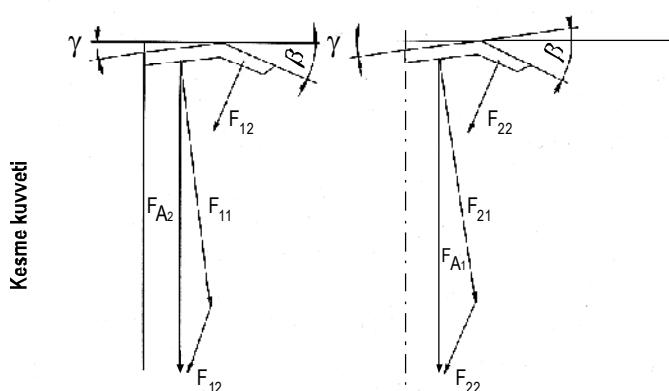

## Su Besleme

Takım dönerken su basıncı normalin üzerinde olduğu zaman talaş takım üzerinden daha iyi akar.

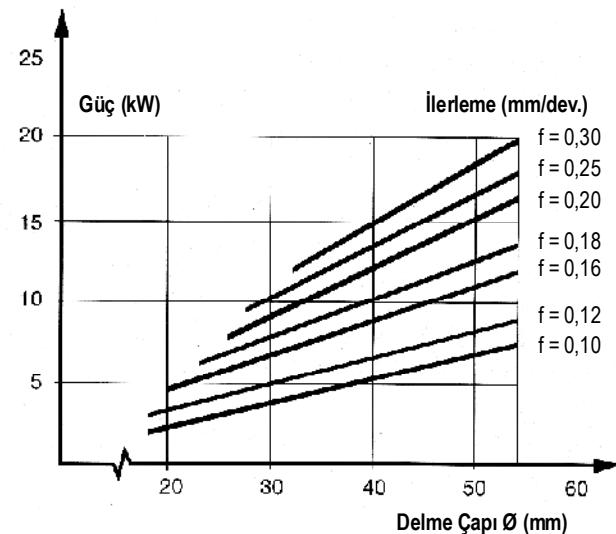

## Kesme Kuvvetlerinin Dengelenmesi

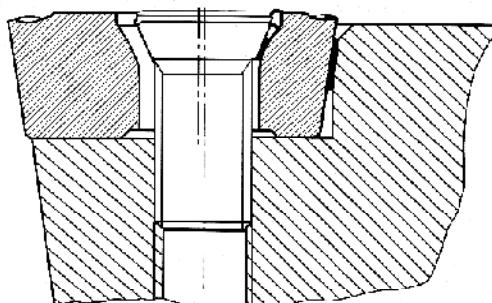

## Bağlama sistemi

Takım üzerinde Uçlar Takımsaş maxilock-S sistem vida ile basit ve iyi bir şekilde bağlanır.

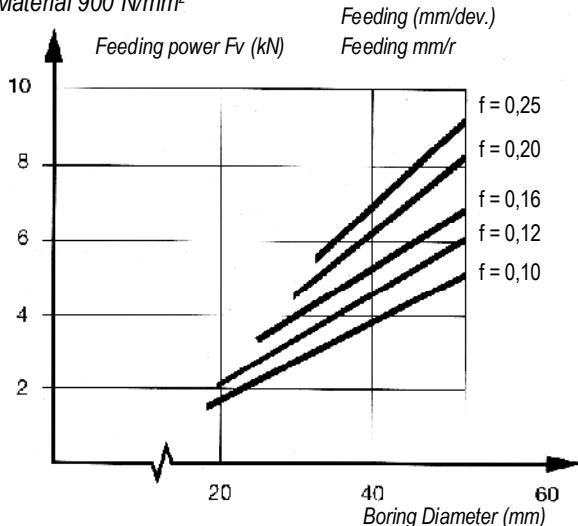

### Security Information

- At the end of cutting process and in the case of cutting tool being stabilized, process material being rotated, a sharp and thin disc occurs. A protective cover is recommended.
  - If the drill rotates by using cooler RING, rotation of RING is important.
  - Using protective cover is recommended to prevent any damage of scattered stones.
- Am Ende der Schneidvorgang tritt eine scharfe und dünne Scheibe auf, indem Schneidwerkzeug stabilisiert wird, wobei das Material gedreht wird. Eine Schutzabdeckung wird empfohlen.
- Wenn der Bohrer durch Kühlerring dreht, ist die Drehung des RING wichtig.
- Die Schutzabdeckung wird empfohlen, um Schaden vom verstreuten Span zu verhindern.

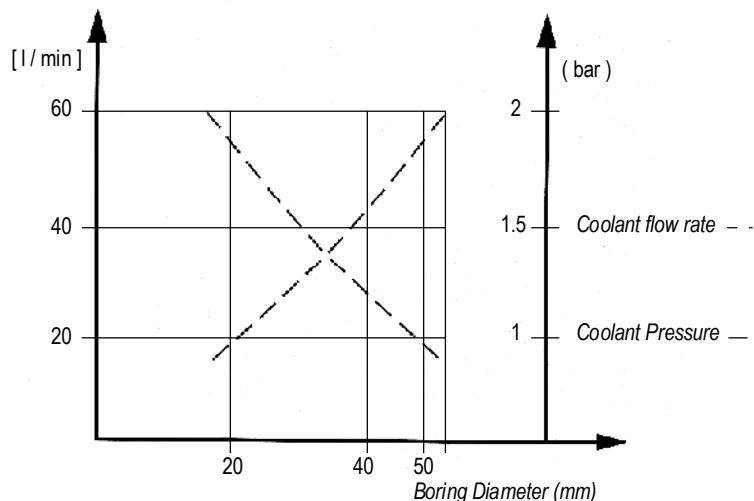

### Feeding Power / Vorschubkraft:

Feeding Power has been determined for cutting speed  
 Vorschubkräfte wurden für die Schnittgeschwindigkeiten ermittelt.  
 $v_c = 120 \text{ m/dak}$   
 Material 900 N/mm<sup>2</sup>

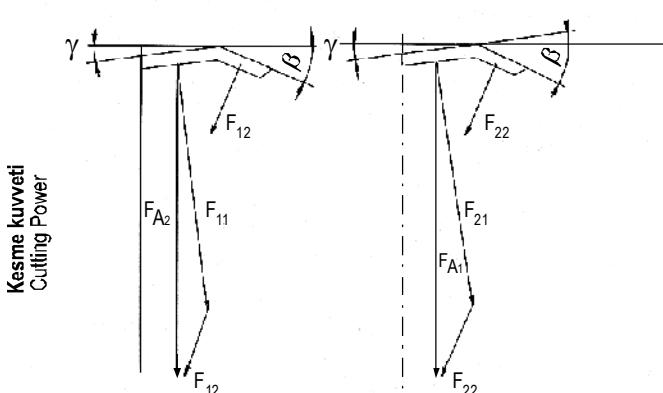

### Water Supply / Wasserleitung:

Chips can flow over rotating tool easily if water pressure is more than standard. Mostly, Water pressure from water supply to tool is adequate. Der Span kann über den drehenden Werkzeug einfacher fleißen, wenn der Wasserdruk hoher als dem Standard-Druck.

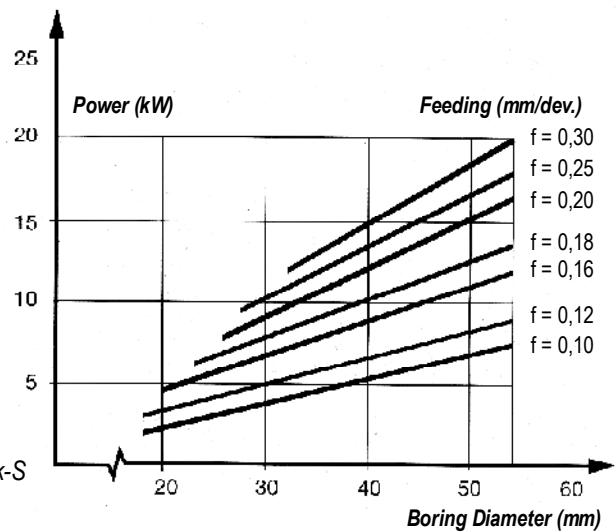

### Balance of Cutting Powers / Die Balance der Vorschubkräfte:

### Clamping System / Klemmsystem:

Inserts can be connected on the tools perfectly by simply Takımaş maxilock-S system screw.

Die Platten können an Werkzeugen durch Takımaş maxilock-S Schraubensystem perfekt verbunden werden.

### Mekanik Şartlar;

Değiştirilebilir uçlu matkapların, amaca uygun kullanıldıkları zaman, oldukça avantajlı ve etkili takımlar olduklarını görebiliriz. Kullanım esnasında mekanik şartların var olması ve hatta tam olarak uygun olması gerekmektedir.

- Kesme hızları kullanılan ucun kalitesi için uygun olmalıdır.
- Fener milinin, ucun gerektirdiği şartlar için yeterli olması gereklidir ( $1000\text{N/mm}^2$ den daha yukarı mukavemetteki çelikler için). Fener milinin delinecek delik çapı için, yeterli motor gücüne sahip olması gereklidir.
- Delinecek iş parçası tezgah tablasına rıjît olarak bağlanmalıdır.  
Tezgah ve bağlanan iş parçasında, vibrasyon olmamalıdır.
- Takımın ilerlemesi uygun seçilmelidir.
- Soğutma sıvısı ve yağ, yeterli basınç ve debije sahip olmalıdır.
- Delme esnasında emniyet tedbirlerinin tam olarak alınması gereklidir.

### İşlenecek parça malzemesi

Kesme işlemi sırasında, talaş formu açısından, kısa talaş açığa çıkarılan malzemeler ile uzun talaş açığa çıkarılan malzemeler arasında gözle görülebilir farklılıklar vardır. Talaşın uygun bir şekilde atılması; kısa talaş açığa çıkarılan malzemelerin, uzun talaş açığa çıkarılan malzemelere göre daha az problemlı oldukları görülür. Bütün çelik çeşitleri ve demir içermeyen (non-ferrous) malzemeler işleme anında uzun talaş açığa çıkarırlar.

Delinecek malzemeler için kullanılacak ucun, talaş kırıcı formunun ideal bir şekilde seçilmiş olması ve buna göre kesme şartlarının uygulanmış olması durumunda, tüm çelik çeşitleri ve demir içermeyen (non-ferrous) malzemelerde başarılı sonuç alınabilir. Değiştirilebilir uç olarak WCMK-WCMT ve benzeri uçlarla iyi sonuç alınabilir.

Genel olarak, kesme kenarları ekstra yuvarlatılmış olan uçlar tercih edilmelidir (ISO'ya göre S tipi). Bununla beraber, bütün çelik ve döküm çeşitlerinde; MOLIBDEN TZM, hafif metaller ve demir içermeyen (non-ferrous) metallerde kullanılan uçlar ise ( ISO'ya göre F tipi ) keskin kenarlı olanlardır ve uygulamada daha iyi sonuç verirler.

Kesmede ideal olan kısa talaşı elde etmek, malzemenin cinsine, ucun kalitesine ve kesme şartlarına bağlıdır.

### Uç seçimi

Ideal şartlarda kesmeyi sağlamak için, işlenecek parça ile seçilen uç arasında iyi bir eşleşme olmalıdır; bunun için WXML-WCMT ve benzeri uçlar uygundur. Yüksek kesme hızları için çok katlı kaplama yapılmış uçlar tavsiye edilir ( örnek : TiC, Ti(c,n), TiN-P35 ve Al<sub>2</sub>O<sub>3</sub> P15/K15). Düşük kesme hızları için kaplamaz uçlar (P25, P35, K15) tavsiye edilir. Kaplamalı ve kaplamaz kalitelerde (P25-P35) kesme kenarları yuvarlatılmış veya negatif pah olabilir. Kısa talaş açığa çıkarılan malzemelerde (döküm) kullanılan K20 ve K30 tipi uçların kesme kenarları ise keskindir (F). Delme esnasındaki kesme hızı, kesici uç radyusuna uygun olursa (diş çapa), merkezde kesme yapan ucun o çaptaki kesme hızı ( $V_c = 0$ ) sıfır olur. Merkezdeki kesme hızının düşük olması ( $V_c$ ), merkezdeki ucun dışarıdaki uca göre daha fazla yüze maruz kalmasına sebep olur. Darbeli kesmelerde talaş merkezdeki ucun üzerine yapışır ve ucun üzerine gelen basıncın artmasına neden olur. Bu yüzden, merkezdeki ucu aşınmaya karşı değil, kırılmaya karşı daha dayanıklı seçmemiz gereklidir, örneğin P30-P40 gibi.

### Mechanical Conditions

When the drills having indexable insert are used on exactly relevant process, we can get all advantages and efficiency of modern technology. During process, mechanical conditions must be convenient.

- Cutting speeds must be compatible with the insert quality
- Tool spindle must be adequate for cutting conditions (for the steels having resistance higher than  $1000\text{N/mm}^2$ ). Tool spindle must have adequate engine power.
- The work piece to be drilled must be fixed to the workbench tightly to prevent vibration.
- Feeding must be chosen appropriately.
- Cooling water and lubricant must have adequate pressure and flow rate during process.
- During process all safety precautions must be applied exactly.

### The Work Piece Material

During process, we can observe reasonable differences between the chips arising from materials in terms of chip form. For easy chip removing, the materials having short shaped chips have less problems than the materials having long shaped chips. All steel qualities and nonferrous materials form long chips.

When the chip breaker is chosen properly for the material and cutting condition the application is perfect and successful for especially steel and nonferrous materials. The most suitable insert type is WCMX-WCMT or similars.

In general we prefer inserts having rounded cutting edges (type S according to ISO). However the best results for steels, cast iron, MOLIBDEN TZM, light and nonferrous metals can be achieved using inserts having sharp cutting edge, type F in ISO.

To achieve short chips that is preferable depends to the material, insert quality and cutting conditions.

### Choosing Insert

There should be a good correlation between the insert and material to be machined for ideal cutting; for this, WXMX-WCMT and similar type of inserts are suitable. The inserts having multiple layer coating are recommended for higher level cutting speeds (e.g. TiC, Ti(cn), TiN-P35 and AlO3P15/K15). The inserts without coating are recommended for low level cutting speeds (e.g. P25, P35 and K15). Both inserts coated or un-coated (P25-P35) may have cutting edges rounded or chamfered negatively. The inserts used for some casted materials producing short chips like K20 and K30 have sharp cutting edges (F). While drilling, if the cutting speed is properly chosen for the insert radius (external diameter), the cutting speed of the insert on the center is  $V_c = 0$  according to the diameter. Lower cutting speed of the central insert results in higher pressure and load on the outer insert. Especially while intermittent cutting, chips stack on central insert and causes excess pressure on the insert. So, inserts on the center must be chosen as resistant to breaking not resistant to wear.

### Mechanische Bedingungen:

Wenn Wendeplattenbohrer werden auf genau entsprechendes Prozess verwendet, kann man alle Vorteile und Leistungsfähigkeiten bekommen. Während des Prozess müssen die mechanischen Bedingungen zweckmäßig sein.

- Die Schnittgeschwindigkeit muss vereinbar mit der Qualität sein.
- Die Werkzeugspindel muss angemessen für die Schnittbedingungen sein. (für Stahl mit Widerstand hoher als  $1000\text{ N/mm}^2$ ) Die Spindel muss einen angemessenen Motorkraft haben.
- Das Werkstück, das gebohrt wird, muss ganz fest an der Bohrentisch befestigt werden, um die Vibration zu verhindern.
- Der Vorschub muss angemessen gewählt werden.
- Das Kühlwasser und Schmiermittel müssen ausreichenden Druck und Durchfluss haben.
- Während des Prozess müssen alle Sicherheitsvorkehrungen genau angewendet werden.

### Das Werkstückmaterial

Während des Vorgangs können wir vernünftige Unterschiede zwischen den Span aus Werkstoffen in Bezug auf die Spanform beobachten. Werkstoffe, die kurze Spanform haben, wenige Probleme als Werkstoffe mit der langen Spanform bei der Entfernung vom Span. Alle Stahlarten und Nichteisenmetalle haben lange Spanform.

Wenn die Spanformrille wird korrekt für das Material und die Schneidbedingungen gewählt, ist die Anwendung perfekt und erfolgreich besonders für Stahl und Nichteisenmetalle. Die am besten geeignete Art der Wendeplatte ist WCMX-WCMT oder die ähnlichen. Im Allgemeinen bevorzugen wir die Platten mit der abgerundeten Schnittkanten. (Typ S nach ISO-Standard). Allerdings erreicht man das beste Ergebnis für den Stahl, Gusseisen, Molybdän TZM und Leichtmetall, indem die Platten mit der scharfen Schnittkanten benutzt werden.

### Wendeplatte wählen:

Für den optimalen Schnitt soll es eine gute Zusammenhang zwischen der Platte und dem Material, die bearbeitet werden. Dafür passt das Plattentyp WXMX-WCMT oder die ähnlichen. Die mehrfach beschichtete Platten werden für die hohe Schnittgeschwindigkeiten empfohlen. (z.B TiC, Ti(cn), TiN-P35 und AlO3P15/K15). Die nicht geschichtete Platten ist geeignet für die niedrige Schnittgeschwindigkeiten. (z.B.P25, P35 und K15). Die beiden Platten, beschichtet oder nicht beschichtet haben runden und negativ Geschwindigkeit der Platte in der Mitte  $VC=0$  je nach dem Durchmesser. Die niedrige abgeschrägten Schnittkanten. Die Platten (K20- K30), die für kurz Spanform produzierte Materialien geeignet wird, haben scharfen Schnittkanten. Wenn die Schnittgeschwindigkeit ist korrekt für den Plattendurchmesser beim Bohren gewählt wird, ist die Geschwindigkeit der zentralen Platte führt zu einem höheren Druck an der äußeren Platte. Besonders stapelt der Span auf die zentrale Platte und das verursacht einen Überdruck auf der Platte. Also die zentralen Platten sollen je nach dem Gegenstand gegen Bruch gewählt werden; nicht gegen Verschleiß.

## Kesme değerleri

### Kesme değerlerinin optimizasyonu

Genel olarak, ilerleme arttırdığı zaman kısa talaş elde edilir. Diğer taraftan ilerleme sabit tutulup kesme hızı arttırdığı zaman daha uzun talaş elde edilir ki, bu da tavsiye edilmez. Daima kısa talaş açığa çıkaracak kesme şartları oluşturulmalıdır.

### Soğutma sıvısı

Talaşın dışarıya kolay atılabilmesi için kesme sıvısı ve yağ veya basınçlı hava kullanılır. Özellikle derin deliklerde ( $>1x$  nominal çap) veya matkabın dik olarak kullanılması durumunda talaş kanallarının tıkanmasına meydan vermemek için, çıkan talaşın kısa ve küçük, kesme sıvısının basınç ve debisinin yeterli olmasına dikkat etmeliyiz. Soğutma sıvısı ve yağ veya basınçlı hava, kesme esnasında delik içerisinde oluşan ışını önler, bu da kesici ucun ömrünü artırır, talaşın uygun şekilde kırılmasına ve gerekli ölçünün daha düzgün elde edilmesine yardımcı olur.

### Takım ömrünü etkileyen faktörler

Kesme kenarının aşınması takım ömrü için önemli göstergedir. Müsaade edilen oran kesici ucun kalınlığının  $1/10$ 'udur. İdeal kesme şartlarında, delinecek parçanın malzemesine bağlı olarak, kesme kenarı başına ortalama  $8000 \text{ mm}^2$ lik delme uzunluğu sağlanabilir (Yaklaşık  $1000 \text{ N/mm}^2$ ).

Kesme kuvvetleri, kesici ucun kesme kenarının aşınmasıyla artar ve bu yüzden takım veya makinaya ekstra yükler biner. Eğer kesme kuvvetini otomatik olarak denetleyen bir sistem yok ise, kesme kenarının aşınmasını mutlaka düzenli olarak kontrol etmeliyiz. Aşırı aşınma sonucu kesici ucun üzerine ağır yükler geliyor ise, kesici uç kırılır ve takım büyük zararlar görebilir; hatta kullanamaz hale gelebilir.

Kesici uç değiştirirken, uç yuvasının temiz olmasına ve kesici uç kenarında yapışmış talaş ve herhangi bir kırık olmadığına dikkat etmeliyiz, aksi takdirde elde edilecek delik çapı nominal delik çapından daha küçük olur.

### Delik delme

Değiştirilebilir ucu matkap döndürülerek, işlenecek parça sabitken yatay veya dikey delme işlemi yapılabilir. İşlenecek parça dönerken ve takım sabitken delme ekseni sapma ihtimali vardır, bu durumda nominal çapa göre eksen düzeltilerek uygun delik elde edilir. Aksi takdirde delik küçük veya büyük çıkacağı gibi, takım da zarar görebilir.

Değiştirilebilir ucu matkap ile delme yapılrken delinecek malzemenin yüzeyi düzgün değilse, ilerleme hızı ona göre hesaplanmalıdır. Kavisli ( iç bükey / dış bükey ) yüzeyler delinirken ilk temasda dışındaki veya merkezdeki uçlardan sadece bir tanesi kesme yapar. Bu durumda radyal kuvvetler dengelenemez. İç bükey ve dış bükey yüzeylerde delme işlemi yaparken tam temas (her iki uçtan) sağlanıncaya kadar ilerleme yarıya düşürülür ve tam temas (her iki uç) sağlanınca ilerleme tam olarak uygulanır.

### Cutting Values

Generally, increasing feeding results in short chips. On the other side, if you keep feeding speed constant while cutting speed is increasing, you get long chips that is not recommended. Always it should be provided cutting condition as to produce short chips.

### Coolant

In several cases, a convenient mixture of water and oil emission or air pressure are used to flow chips out easily. It should be taken care of that the chips arised is short and the pressure/flow rate of the coolant is convenient to prevent blockage along chip channels while especially deep drilling ( $> 1 \times$  nominal diameter) or vertical drilling. Water/oil mixture or air pressure for cooling prevent chips accumulation in drilling hole and keeps the heat stable during cutting process, whereupon it increases the life time of the insert, enables correct dimensioning and broken chips conveniently.

### Factors Effecting Tool Life

Wear on cutting edges is an impotant indicator for tool life. Permitted ratio for wear indication is 1/10 of the insert thickness. Under the ideal cutting conditions, it can be drilled 8000 mm of length in average depending upon the material specifications (approximately 1000 N/mm<sup>2</sup>).

Cutting forces increase as the wear on cutting edges increase, this causes extra loads on the machine and the tools. If there is not any system to control cutting forces, wear on cutting edges must be checked regularly. If over load occurs on the insert as a result of wearing, the insert will be possibly broken and the tool also will be damaged.

As an addition, while changing the insert, the insert seat must be clean and there must not be any chip stacked on the insert edge and must not be any broken part. Otherwise, the drilled diameter can be smaller than the nominal hole diameter.

### Drilling

Drilling can be done vertically and horizontally while the part is stabilized and the drill hold fixed on the toolholder is rotating. When there is probability of deviation, in this condition, according to the nominal diameter, a convenient running can be got by correcting the position of axis. Otherwise decisive hole diameter can be smaller or larger than the needed one and tool can be damaged.

During drilling the feeding speed must be chosen according to the surface quality.

While drilling thru concave or convex surfaces, in the first contact, only one insert touches the surface, outer or inner. In this situation, radial forces can not be balanced. When drilling thru concave or convex surfaces, feeding speed should be chosen as half of that should be up to full contact then adjusted to normal level.

---

### Schnittwerte

In der Regel ergibt die Erhöhung des Vorschubs kurze Spanform. Wenn man andererseits die Vorschubgeschwindigkeit konstant hält, bekommt man lange Spanform, während die Schnittgeschwindigkeit erhöht wird. Man soll immer die Schnittbedingungen so feststellen, dass kurze Spanform hergestellt wird.

praktische Mischung von Wasser und Öl oder Druckluft verwendet, damit der Span leicht entfernt wird. Man soll darauf achten, dass die Spanform kurz entstanden wird und dass Druck/Fluss Rate der Kühlmittel zweckmäßig.

### Kühlmittel

In mehreren Fällen wird eine ist, um die Verstopfung zu verhindern, besonders während des Tieflochbohrens und vertikalen Bohren. Wasser / Öl Mischung oder die Druckluft für die Abkühlung verhindert die Ansammlung des Spans im Bohrloch und hält die Hitze stabil beim Bohren.

### Faktoren für Werkzeugstand

Der Verschleiß an der Schneidkanten ist eine wichtige Angabe für die Standzeit. Das zulässige Verhältnis vom Verschleiß ist 10 % von der Plattendicke. Unter idealen Schnittbedingungen kann man durchschnittlich die Länge von 8000 mm je nach Werkstoff-Spezifikationen bohren. (ca. 1000 N/m<sup>2</sup>)

Die Schnittkräfte wird vergrößert, da der Verschleiß an der Schnittkanten vergrößert wird und es verursacht zusätzliche Belastungen auf die Maschine und dem Werkzeug. Wenn es kein Kontrikksystem für die Schnittkräfte gibt, muss der Verschleiß an der Schnittkanten regelmäßig überprüft werden. Wenn die Platte als Folge von dem Verschleiß überlastet, wird sie möglicherweise gebrochen und so wird auch das Werkzeug beschädigt.

Beim Wechsel der Platte muss der Plattensitz gereinigt sein und kein Span oder gebrochene Teile müssen sich an der Spankante befinden. Sonst kann der gebohrte Durchmesser kleiner als den nominalen Durchmesser.

### Bohren

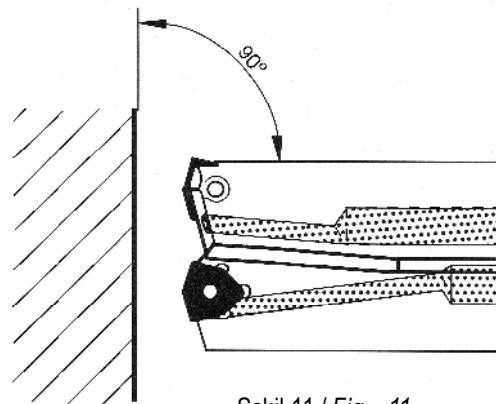

Man kann das Material vertikal und horizontal bohren während der Werkstoff stabil ist und der am Halter festgebohrte gedreht wird. Wenn es eine Möglichkeit der Abweichung vom nominalen Durchmesser gibt, muss man die Position der Achse korrigieren. Sonst kann der entschiedene Bohrungsdurchmesser kleiner oder größer als die benötigte sein. So kann das Werkzeug beschädigt werden.

Beim Bohren soll die Vorschubgeschwindigkeit nach der Qualität der Oberfläche gewählt werden. Während des Bohrens der konkaven oder konvexen Oberfläche berührt nur eine Platte auf die Oberfläche - die Innere oder Äußere. In diesem Fall können die radialen Kräfte nicht ausgeglichen werden. So soll man die Vorschubgeschwindigkeit um die Hälfte reduzieren, bis der vollständige Kontakt entstanden wird. Dann kann man die volle Vorschubgeschwindigkeit verwenden.

Şekil 11 'deki gibi takımın düz bir yüzeye girişi en ideal olsadır.

*As in figure 11, the ideal entering position to drill is thru flat surface.*

Wie in der Abbildung 11 zu sehen, wird das ideale Bohren auf der ebenen Oberfläche verwendet.

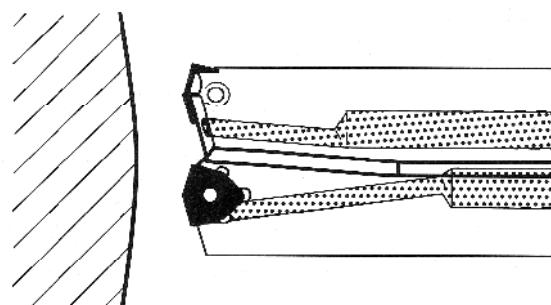

Şekil-11 / Fig. - 11

Şekil 12 'deki gibi dışbükey yüzeye delme yapılrken, önce merkezdeki uç malzemeye temas eder. Tam temas sağlanıncaya kadar ilerleme hızı olmasi gereken değerin yarısı alınmalıdır.

*As in figure 12, while drilling thru convex surface the insert at the center touches first. The feeding speed should be kept half of that should be up to full contact.*

Wie in der Abbildung 12 zu sehen, berührt erst die mittlere Wendeplatte die Oberfläche beim konvexen Bohren. Die Vorschubgeschwindigkeit soll um die Hälfte bis zum vollständigen Kontakt reduziert werden.

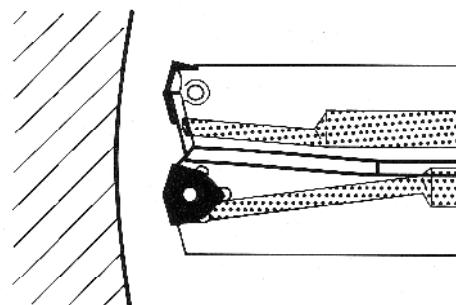

Şekil-12 / Fig. - 12

Şekil 13 'deki gibi içbükey yüzeye delme yapılrken, önce dışındaki uç malzemeye temas eder. Tam temas sağlanıncaya kadar ilerleme hızı olmasi gereken değerin yarısı alınmalıdır. Aksi takdirde, uca gelen yükün artmasından dolayı uç ve uç yuvası zarar görebilir.

*As in figure 13, while drilling thru concave surface the outer insert touches first. The feeding speed should be half of that should be up to full contact. Otherwise the insert and the seat may be damaged by overload on the insert.*

Wie in der Abbildung 13 zu sehen, berührt erst die äußere Wendeplatte die Oberfläche beim konkaven Bohren. Die Vorschubgeschwindigkeit soll um die Hälfte bis zum vollständigen Kontakt reduziert werden. Sonst kann die Wendeplatte wegen der Überlastung beschädigt werden.

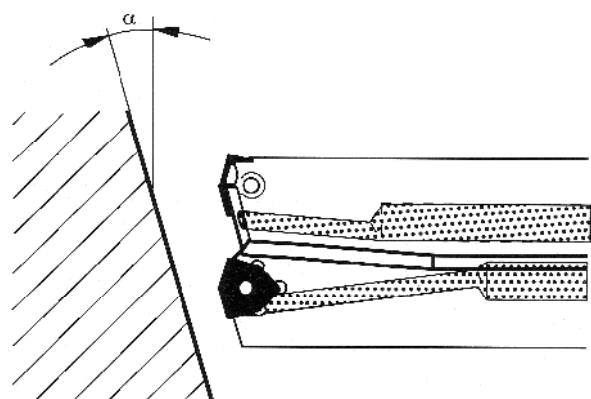

Şekil-13 / Fig. - 13

Şekil 14 'deki gibi eğimli yüzeye delme yapılrken, önce dışındaki uç malzemeye temas eder. Tam temas sağlanıncaya kadar ilerleme hızı olmasi gereken değerin yarısı alınmalıdır.

*As in figure 14, while drilling thru inclined surface the outer insert touches first. The feeding speed should be half of that should be up to full contact.*

Wie in der Abbildung 14 zu sehen, erst die äußere Wendeplatte die Oberfläche beim geneigten Bohren. Die Vorschubgeschwindigkeit soll um die Hälfte bis zum vollständigen Kontakt reduziert werden.

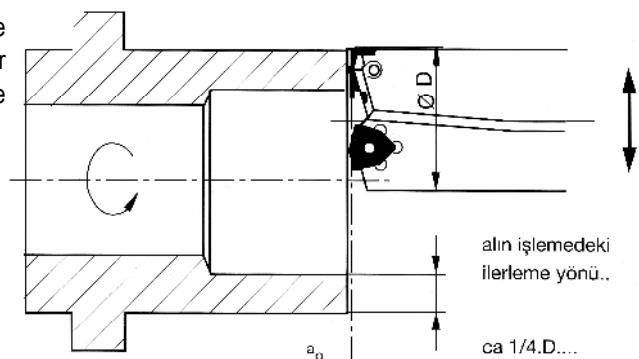

Şekil-14 / Fig. - 14

## Alın yüzey işleme

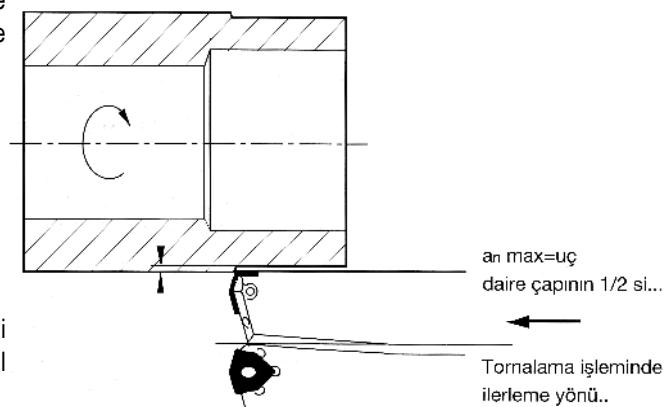

Değiştirilebilir uçlu matkaplar belirli limitler dahilinde yüzey işleme işlemleri için de kullanılabilirler. Yüzey işleme işlemi yalnızca bir taraftaki uçla kısıtlı olarak yapılabilir. Kesme derinlikleri ucun ölçüsü ve matkabin yapısına bağlıdır.

İşlenebilecek yüzey çapı, takımın nominal çapına bağlıdır.

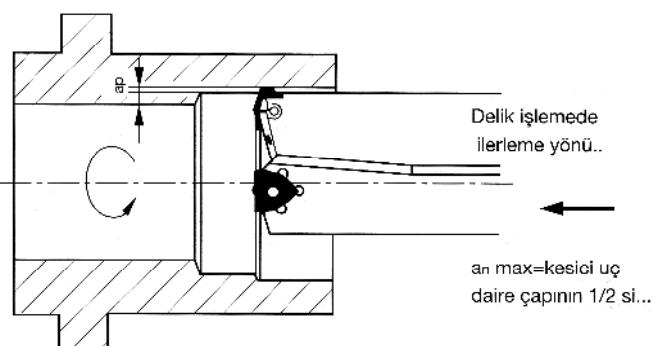

## Tornalama

Değiştirilebilir uçlu matkaplar ile yapılabilecek tornalama işlemleri de matkabin çapı ve kesici ucun ölçüsü ile sınırlıdır. Olabilecek kesme derinliği, takımın çapına bağlıdır. şekil 16'da verilmiş örnekteki gibi.

## Delik delme

Delme esnasında, tornalama işleminde verilen sınırlamaların hepsi geçerlidir. Matkap öncelikle delme takımıdır. Ve sadece, bazı özel durumlarda asıl fonksiyon dışında kullanılabilir.

## Dönerek / durarak çalışan takımlar

Değiştirilebilir uçlu matkaplar, delik delme işlemi için en ekenomik ve avantajlı takımlardır. Delinecek malzeme ve delme takımının rıjît bağlanmış olması ve yeterli soğutma önemlidir. Takımın veya delinen malzemenin dönmesi ile birlikte takımın dikey veya yatay kullanılması önemli değildir. Takımın sabit parçasının dönmesi durumunda, iş parçasının bağındığı ayna veya pens kafasının, delme işlemini yapacak olan takım ile aynı eksende olması gereklidir. Eksen ayarı iyi yapılmadığı takdirde nominal delme çapında sapma olur ve delme işlemi sırasında takım hasar görebilir.

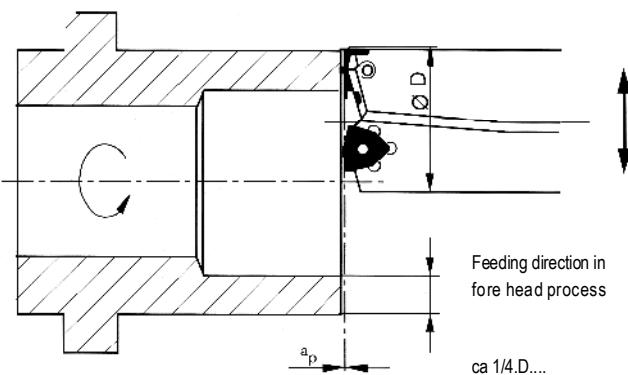

## Merkezden kaçık delme işlemi

Değiştirilebilir uçlu matkaplar, iş parçasıyla aynı merkezli olmayacak şekilde ayarlanmış ise buna merkezden kaçık delme işlemi denir. Bu durumda delik, nominal delme çapından büyük veya küçük olacaktır. Eğer kısıtlı olarak merkezden kaçık işlem yaptıryorsak bu işlem sadece dış çaptaki ucun kesme kenarına paralel yapılmalıdır ve bu delinecek çapı belirleyecektir. Eğer merkezden uzakta pozisyonlama yapılyorsa ve çap ölçüsünü küçültürse, matkap gövde çapının delinen deliğin çeperine sürtünme olasılığı artar ve de bu takımın gövde yüzeylerinin kullanılamaz duruma gelmesi ile birçok problemi yaşamamızı ve hatta takımın devre dışı kalmasına neden olur. Ayrıca işlenecek delik zarar görebilir ve hatta iş bozuk olabilir. Müsaade edilebilir ayar limitleri, takımın nominal çapına bağlıdır.

## Face Turning / Plandrehen

The drills having interchangeable insert can be used also for face turning in certain limits. Face turning can be done only with one of the insert. Cutting depth is limited by the form of the insert and mechanical structure of the drill. On the other side, diameter of cut depends on the tool's nominal diameter.

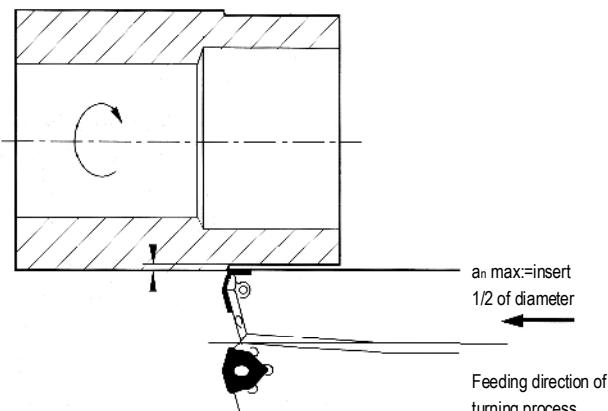

Der Bohrer mit der Wendeleiste kann auch zum Plandrehen in bestimmten Grenzwerten benutzt werden. Das Plandrehen kann aber nur mit einer von der Wendeleisten durchgeführt werden. Die Schneidtiefe wird durch die Plattenform und die mechanische Aufbau des Bohrers begrenzt. Der Schnittdurchmesser ist abhängig vom nominalen Durchmesser des Werkzeugs.

## Turning / Drehen

Turning with the drills having interchangeable insert is limited with the diameter of the drill and form of the insert. Possible cutting depth depends on the diameter of tool as in the example of figure 16.

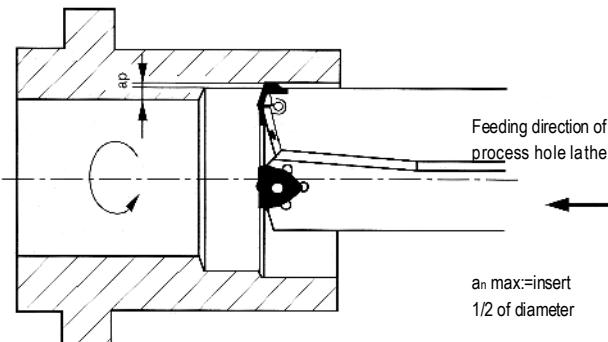

Das Drehen mit der Wendeleiste wird durch den Bohrdurchmesser und die Plattenform begrenzt. Die mögliche Schneidtiefe ist abhängig vom Durchmesser des Werkzeugs wie in der Abbildung 16 zu sehen ist.

## Drilling / Bohren

While drilling, all the constraints given for the turning are valid. First, the drill should be categorized as boring tools and it shouldn't be used for turning except some special conditions.

Beim Bohren sind alle Beschränkungen gültig, die man beim Drehen hat. Zunächst ist der Bohrer ein Bohrwerkzeug und soll nicht beim Drehen außer manchen besonderen Bedingungen verwendet werden.

## Drills working by turning or stationary position

The drills having interchangeable inserts are the most economical drilling tools and carries advantages when they are adjusted for full bore. It should be taken account that the workpiece and the tool must be clamped tight; and to supply coolant as well. It is not important whether the workpiece or the tool turns, or whether tool is positioned as vertically or horizontally.

If the tool is stationary and workpiece turning, the axis of the chuck or collet should be same with the axis of the tool. If it is not, it should be adjusted; otherwise, there will be a deviation on the nominal diameter and the tool possibly will get some damages during drilling.

## Bohrer drehen oder Werkstoff drehen:

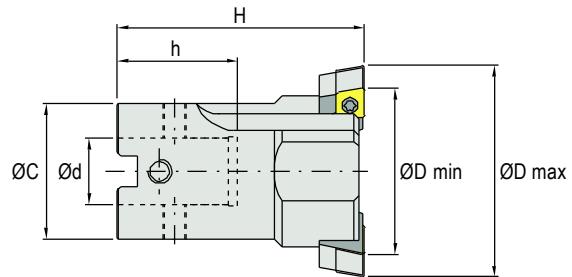

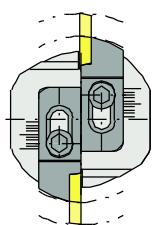

Der Wendeleistenbohrer sind wirtschaftlichste und günstige Bohrwerkzeuge. Man soll beachten, dass das Werkzeug und der Werkstoff festgeklemmt werden. Dabei soll man es gut abkühlen. Es ist nicht wichtig, ob das Werkzeug oder der Werkstoff gedreht wird; oder ob das Werkzeug vertikal oder horizontal angeordnet wird.

Wenn der Werkstoff gedreht wird, sollen Achsen des Spanfutters und der Spanzange gleich zur Achse des Werkzeugs sein. Sonst soll man es verbessern. Wenn man das nicht tut, gibt es eine Abweichung im nominalen Durchmesser und das Werkzeug kann beim Bohren beschädigt werden.

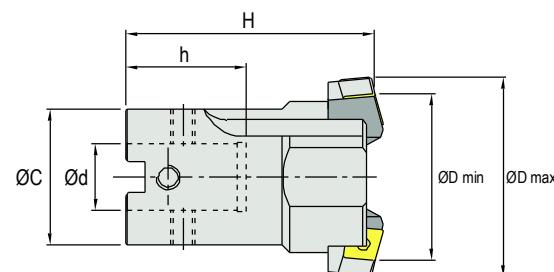

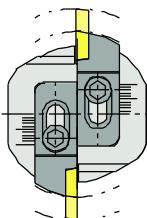

## Drilling out of center / Bohren außerhalb der Mitte:

If the drills having interchangeable insert are adjusted to be in different centers, it is called drilling out of center. In this situation, the hole diameter can be smaller or greater than nominal drilling diameter. If the tool is adjusted as to be out of center willingly, the cutting must be applied only in a parallel position to the cutting edge of external insert. This positioning decreases hole diameter, then the probability of friction between drill's body and hole wall increases, whereupon it causes damages on tool's body and tool may become out of order. Permissible adjusting limits depends on nominal tool diameter.

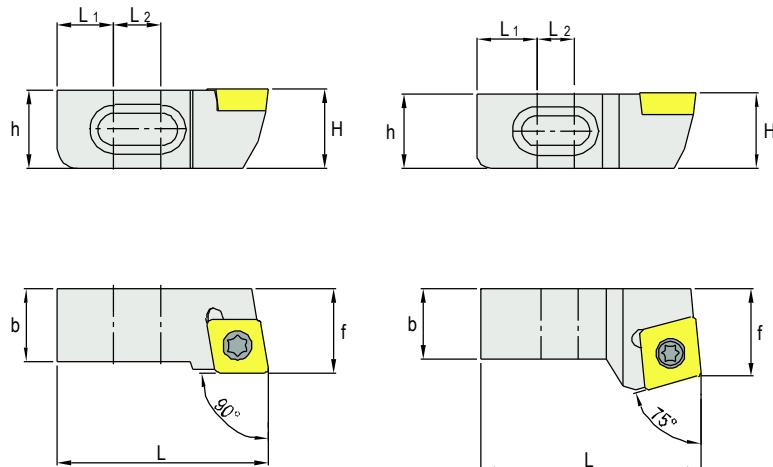

Wenn die Wendeleistenbohrer in verschiedenen Zentren eingestellt werden, nennt man es, "Bohren außerhalb der Mitte." In diesem Fall kann der Lochdurchmesser kleiner oder größer als den nominalen Bohrungsdurchmesser sein. Wenn man das Werkzeug absichtlich außerhalb der Mitte einstellt, soll das Bohren nur parallel zur Schneidekante der äußeren Platte angewandt werden. So wenn der Lochdurchmesser bei dieser Art des Bohrens verkleinert wird, dann ist eine Reibung zwischen Bohrer und Lochwand möglich und darauf verursacht es Schaden am Werkzeug. Zulässige Grenzwerte der Einstellung sind abhängig vom nominalen Werkzeugdurchmesser.

**ÖZELLİĞİ**

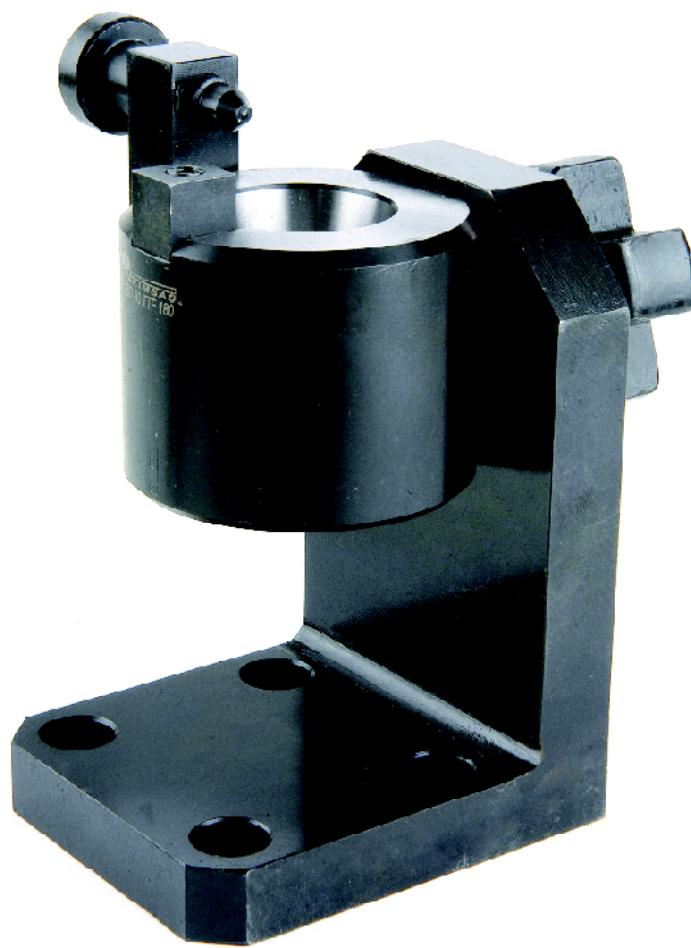

1. Kesici takımların ve çekirme vidalarının kolayca sökülebilmesine olanak verir.
2. Takım sıkma ve takma fikstürü 5 farklı pozisyonda ayarlayıp kullanabilirsiniz.
3. Maximum kullanım kolaylığına olanak verecek şekilde dizayn edilmiştir.
4. İş masasına veya herhangi bir takım masasına kolayca monte edilebilecek şekilde dizayn edilmiştir.
5. Takım tutucu kısmı sertleştirilmiş ve hassas işlenmiştir.

**FUNCTIONS**

1. It provides the possibility of easily mounting and dismounting of cutting tools.
2. You can use tool dismounting and mounting fixture by adjusting 5 different position.
3. It has been designed to get maximum usage friendly.
4. It has been designed to be assembled on any tool table or worktable.
5. The side of toolholder has been hardened and processed delicately.

**FUNKTIONEN**

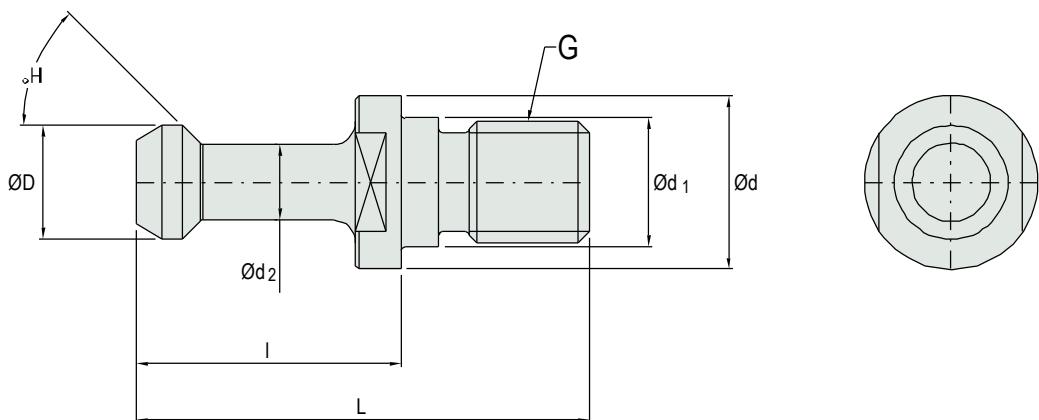

1. Es bietet die Möglichkeit, sehr einfach Montage und Demontage der Schneidwerkzeuge
2. Sie können mit Werkzeug Demontage und Montage Befestigung durch Verstellen 5 verschiedene Position.
3. Es wurde entwickelt, um maximale Nutzung freundlich.
4. Es wurde entwickelt, um auf jedem Werkzeug-Tabella oder Arbeitstisch montiert werden.
5. Die Seite der Werkzeughalter wurde gehärtet und fein verarbeitet.
